

USER MANUAL

<https://github.com/Lujancr/Emergency-Room-Management-System>

Getting Started:

- ❖ Download our code from the repository link above
 - ❖ If you want to add valid credentials, put them in the required format in the credentials.txt file
 - ❖ Remove any past patient data from the patient.txt file, as it is example data
 - ❖ Change the port (on line 18 of LoginFrame.java) to whatever your desired port is
-

How To:

- ❖ First, the machine that will be hosting the server should run the file “HospitalServer.java”
 - ❖ When the server is running, you will see this message “Listening on port 2620 (max 20 clients)” (or whatever port you selected) in the server machine’s terminal
 - ❖ Now, the users will run the file “LoginFrame.java” on their local machine
 - ❖ Users may now sign in using their sign in window with any valid credentials in credentials.txt
 - ❖ Users must enter the ip address of the machine that the server is running on
 - ❖ Once a user logs in, they will get the assigned nurse or doctor GUI window depending on who they logged in as
 - ❖ If this does not happen, then the ip address is incorrect or the credentials are invalid
-

Components:

- ❖ Once you are in the chat room, you will see many different components of the chatroom GUI on your screen.
- ❖ Nurses will have:
 - Create Patient Button
 - New Patient Button
- ❖ Doctors will have:
 - Discharge Button
 - Edit Bill
- ❖ All will have the option to edit patient info, scroll through patients, search through patients, open the patient’s bill, change text in text fields
- ❖ Once these changes are committed, all other doctors/nurses can see them!
